

PROJECT DOCUMENTATION

Script-Controlled ACL – Restrict Record Access Based on Field Value

Date	30 September 2026
Team ID	SWTID-2026-8983
Team Size	5
Team Email ID	_____
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value

PHASE 1 – PROJECT PLANNING & REQUIREMENTS

Project Overview: The project implements a Script-Controlled Access Control List (ACL) in ServiceNow to restrict or allow record access based on the value of a selected field.

Step 1: Team Details

- NITHYA SREE S – Team Leader
- RAMASRI D – Team Member
- PRATHISHA S – Team Member
- MEGALA M – Team Member
- MANJARI T – Team Member

Step 2: Problem Statement

In ServiceNow, some records may need different access permissions depending on a field value. A normal access rule may not provide this field-based restriction. This project uses an ACL script to check the field value and control whether the record can be accessed.

Step 3: Objectives

- Create a Script-Controlled ACL in ServiceNow.
- Restrict record access based on a specified field value.
- Allow authorized records to be accessed when the condition is satisfied.
- Deny access when the condition is not satisfied.
- Test and document the ACL behaviour.

Step 4: Scope

- Identify the target ServiceNow table and field.
- Configure the required ACL and scripting condition.
- Test access with different field values.
- Record the expected and actual access results.

Step 5: Tools / Technologies

- ServiceNow
- Access Control Lists (ACL)
- Server-side JavaScript
- ServiceNow Tables and Fields
- Web Browser

Step 6: Expected Outcome

The system should evaluate the configured field value through the ACL script. Records that satisfy the defined condition should be accessible, while records that do not satisfy the condition should be restricted.

Step 7: Phase 1 Deliverable

Project title, team details, problem statement, objectives, scope, tools and expected outcome are documented and ready for the implementation phase.
