

PROJECT DESIGN – PHASE I

Customer Journey & Problem Understanding

Date	30 September 2026
Team ID	SWTID-2026-8983
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	4 Marks

SCENARIO

Restricting ServiceNow record access based on a field value. A user attempts to view a record and the system checks the relevant field before granting access.

Customer Journey

Stage	What the user does	Interaction	Goal / Motivation	Positive moment	Negative moment
1. Open ServiceNow	Logs in and opens the required application/module.	Login page, application menu, record list.	Reach the required records quickly.	Easy navigation.	Cannot find the required module.
2. Select record	Chooses a record from the list.	List view and record link.	View relevant record information.	Record is easy to locate.	Too many or unclear records.
3. Access check	Attempts to open the record.	Script-Controlled ACL evaluates the field value.	Get access only when authorized.	Authorized record opens.	Unauthorized access is denied.
4. View result	Reads the record or receives an access restriction.	Record form / access-denied response.	Protect sensitive or restricted information.	Clear access behavior.	Unclear restriction message.

Areas of Opportunity

- Check the controlling field before allowing access.
- Combine user permissions with the field-based rule where required.
- Provide clear and consistent denial behavior.
- Test both authorized and unauthorized cases.
- Keep the ACL script simple and maintainable.

Selected Problem Statement

ServiceNow users need controlled access to records based on a specific field value. The system must allow authorized access and prevent unauthorized users from viewing restricted records.
