Team ID	SWTID-2026-8983
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	4 Marks

Brainstorm & Idea Prioritization

Brainstorming helps the team generate possible solutions for controlling access to records in ServiceNow. The ideas below focus on restricting record access according to field values while keeping the solution secure, simple and maintainable.

Step-1: Team Gathering, Collaboration and Select the Problem Statement

Team ID	SWTID-2026-8983

Selected Problem Statement

How can we use a Script-Controlled Access Control List (ACL) to restrict access to ServiceNow records based on a selected field value, so that only authorized users can view or access the records?

Step-2: Brainstorm, Idea Listing and Grouping

Idea	Description	Priority
Script-based ACL condition	Use a server-side script in the ACL to check a record field and allow access only when the condition is satisfied.	High
Role + field validation	Combine the user's role with a field value such as department, assignment group or status.	High
Reusable ACL logic	Keep the access logic clear and reusable so that future field-based restrictions can be maintained easily.	Medium
Negative-access testing	Test unauthorized users and restricted field values to ensure access is denied correctly.	High
Performance check	Verify that the scripted ACL does not noticeably slow record access.	Medium

Prioritized Solution

Implement a Script-Controlled ACL that evaluates a specific record field and grants or denies access according to the defined rule. The solution will be validated using functional and performance test cases.
