## Define the Problem Statements

|               |                                                                     |
|---------------|---------------------------------------------------------------------|
| Date          | 30 September 2026                                                   |
| Team ID       | SWTID-2026-8983                                                     |
| Project Name  | Script-Controlled ACL – Restrict Record Access Based on Field Value |
| Maximum Marks | 4 Marks                                                             |

### Customer Problem Statement

The project focuses on ServiceNow users who need secure access to records. Access should depend on the value of a selected field, but the default access rules may not provide the required field-level restriction. A clear scripted ACL is needed to enforce the business rule.

### Problem Statement Template

| Problem Statement | I am (Customer)                   | I'm trying to                                             | But                                                                          | Because                                                             | Which makes me feel                                      |
|-------------------|-----------------------------------|-----------------------------------------------------------|------------------------------------------------------------------------------|---------------------------------------------------------------------|----------------------------------------------------------|
| PS-01             | a ServiceNow user / administrator | access only the records allowed by a specific field value | normal access rules may allow users to see records that should be restricted | the required field-based access condition is not enforced correctly | concerned about unauthorized record access               |
| PS-02             | a ServiceNow administrator        | apply a clear and maintainable access rule                | complex access logic can be difficult to test and maintain                   | the rule depends on both user permissions and record data           | uncertain whether the access control works in every case |

### Final Problem Statement

ServiceNow users need controlled access to records based on a field value. The project will implement a Script-Controlled ACL that checks the required field condition and grants access only when the defined rule is satisfied, while denying unauthorized access.

### Expected Outcome

The access rule should be clear, secure, testable and consistent for both authorized and unauthorized users.
