

PROJECT IMPLEMENTATION – PHASE IV

Implementation, Demonstration & Final Validation

Date	30 September 2026
Team ID	SWTID-2026-8983
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	4 Marks

Implementation Objective

Implement the Script-Controlled ACL in ServiceNow so that record access is granted or denied according to the selected field value and the defined user permissions.

Implementation Steps

Step	Activity	Expected Outcome
1	Create / configure the required ServiceNow table and field.	Required record data is available.
2	Create the Access Control (ACL) rule for the required record operation.	ACL is available for configuration.
3	Add the script that checks the controlling field value and user permission.	Script returns the correct allow/deny decision.
4	Test the ACL using authorized and unauthorized users.	Correct users can access; restricted users are denied.
5	Review the results and verify that the rule does not cause unnecessary delay.	Access control works consistently and efficiently.

Demonstration Scenarios

Scenario	User / Record Condition	Expected Demonstration Result
Demo-01	Authorized user + allowed field value	Record opens successfully.
Demo-02	Unauthorized user + restricted field value	Record access is denied.
Demo-03	Authorized user + restricted field value	System follows the defined ACL rule and does not bypass the restriction.
Demo-04	Empty / unexpected field value	System handles the condition safely without granting unintended access.

Final Validation Checklist

Check	Validation	Status
1	ACL script is active and applied to the intended record operation.	To be filled
2	Field-based access condition works correctly.	To be filled
3	Unauthorized access is prevented.	To be filled
4	Functional and performance tests are completed.	To be filled
5	Project demonstration is completed.	To be filled

Final Outcome

The completed project demonstrates a Script-Controlled ACL that restricts ServiceNow record access according to a field value. The implementation is validated through functional, security and performance checks.
